

Zaks Foods Sales Portal: Admin Manual

1. System Overview

The Zaks Sales Portal is a standalone web application built with React/Vercel that communicates with a Supabase PostgreSQL database. It integrates with Oracle NetSuite via custom SuiteScript Suitelets that process CSV files generated by the portal.

2. Managing Users

Creating a New User

1. Log in to the **Supabase Dashboard**.
2. Navigate to **Authentication > Users**.
3. Click **Add User** -> **Create New User**.
4. Enter the user's Email and a temporary Password.
5. Uncheck "Auto Confirm User" if you want them to receive an email confirmation, or check it if you want to grant immediate access.
6. Click **Create User**.

Assigning Roles (Admin vs Rep)

By default, new users have standard sales rep privileges. To grant Admin privileges (to see all customers and system logs):

1. In Supabase, go to the **Table Editor**.
2. Open the `user_roles` table.
3. Insert a new row linking the new `user_id` to the `role_id` for "ADMIN".

Sending Login Information

Since the portal is private, users must be provided with the portal URL:

`https://zaks-lion-sales-portal.vercel.app/`

Provide the user with the temporary password you created. They can use the "Forgot Password" link on the portal login page to reset it if needed.

3. NetSuite Integration & Scripts

The portal relies on two core Suitelets to import transactions. If you ever need to update the logic for these, you must update the scripts in NetSuite.

Updating Scripts

1. Go to **Customization > Scripting > Scripts**.
2. Locate the script you want to update (e.g., `Zaks Portal Create Invoice from CSV`).
3. Edit the script record.
4. On the **Script File** dropdown, click the pencil icon to edit the file, and paste the updated

JavaScript code over the existing code.

5. Click **Save** on the file, then **Save** on the Script record. *(Saving the script record purges NetSuite's cache).*

Hardcodes and Locks

***** IMPORTANT: DSD INVOICE WAREHOUSE LOCK *****

Currently, when a rep submits a Direct Store Delivery (DSD) Invoice, the warehouse is strictly hardcoded in the Portal to **Zaks - Edmonton Warehouse**.

- The portal will prevent submission if the inventory at this specific warehouse is zero.
- The `CreateInvoiceFromCSV_SL.js` Suitelet` dynamically maps "Zaks - Edmonton Warehouse" to internal ID `2`` in NetSuite.
- **If you ever need to change the DSD warehouse, you must update the React portal code (`OrderBuilder.tsx``) to change the target warehouse name, and ensure the Suitelet `locationMap`` includes it.**

***** IMPORTANT: SALES ORDER WAREHOUSE LOCK *****

Currently, when a rep submits a standard Sales Order, the warehouse is strictly hardcoded in the Portal to **Zaks - Main Warehouse YYC**.

4. Troubleshooting

Portal Errors

- **"Cannot submit DSD Invoice: Insufficient inventory..."**: This occurs if the rep tries to invoice more product than is currently physically available in the **Zaks - Edmonton Warehouse**. The rep must reduce the quantity, or you must adjust inventory in NetSuite.
- **Missing Activity Logs**: If an activity doesn't log to the timeline, ensure the `activity_type`` string in the portal strictly matches one of the allowed CHECK constraint keywords in the Supabase `activities`` table (e.g., `DRAFT_ORDER``, `VISIT``, `NOTE``).

NetSuite Import Errors

When uploading a CSV to a Suitelet, you may encounter these errors:

- **"Please configure the inventory detail for this line"**: The location you are trying to invoice from has "Use Bins" enforced. Direct invoices cannot be created via CSV for bin-enforced locations. Use the Edmonton warehouse bypass, or manually create the invoice in NetSuite.
- **"Amount Error" / Pricing Missing**: The customer's assigned Price Level does not have a defined price for one of the SKUs on the order. You must fix the item pricing on the Item Record in NetSuite before importing.
- **Missing SKUs**: If the portal allows a SKU that NetSuite doesn't recognize, the Suitelet will skip the item and put a huge `[WARNING: SKIPPED MISSING SKUs: ...]`` note in the Memo field of the transaction. Verify the SKU names match exactly between Supabase and NetSuite.
